- Shoreline
- River & Creek
- Road Network
- Accumulation Zone
- Scarp & Tension Crack
- LANDSLIDE SUSCEPTIBILITY
- Very High
- High
- Moderate
- Low

LANDSLIDE

VERY HIGH  
Areas usually with steep to very steep slopes and underlain by weak materials. Recent landslides, movements, and seismic cracks are present. Human related effects could be an aggravating factor.

HIGH  
Areas usually with steep to very steep slopes and underlain by weak materials. Areas with numerous old and inactive landslides.

MODERATE  
Areas with moderately steep slopes. Soil creep and other indications for possible landslides occurrence are present.

LOW  
Gently sloping areas with no identified landslides.

ACCUMULATION ZONE  
Areas that could be affected by landslide debris.

FLOODS

VERY HIGH  
Areas likely to experience flood heights of greater than 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours. include landforms of topographic lows such as active river channels, abandoned river channels and areas along river banks, also prone to flashfloods.

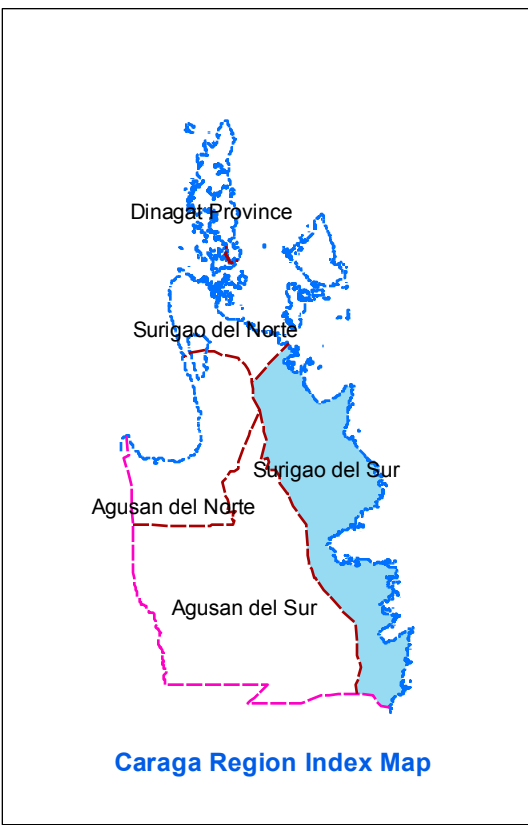

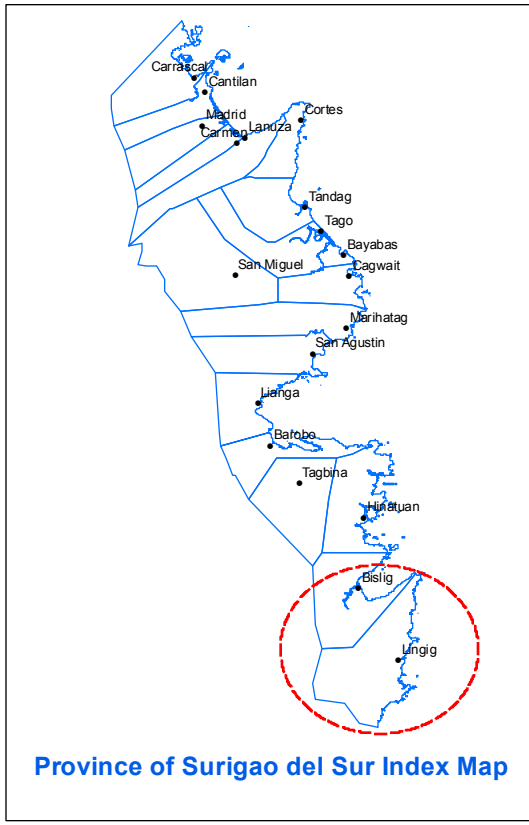

HIGH  
Areas likely to experience flood heights of 1.0 to 2.0 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours. include landforms of topographic lows such as active river channels, abandoned river channels and areas along river banks, also prone to flashfloods.

MODERATE  
Areas likely to experience flood heights between 0.5 and 1 meters and/or flood duration of 1 to 3 days. These areas are subject to widespread inundation during prolonged and extensive heavy rainfall or extreme weather condition. Flood impacts, adverse health and infrastructural are areas moderately subjected to flooding.

LOW  
Areas likely to experience flood heights of 0.5 meter or less and/or flood duration of less than 1 day. These areas include low hills and gentle slopes. They also have spaces to moderate drainage density.
